

Green fertilizer – It consists in seeding plants that fix the nitrogen from the atmosphere and then cut and plow them. This allows the soil enrichment in a natural way and protect it from erosion.

Shredding of the pruning foliage –When the olive trees are pruned, their branches and leaves can be shredded for easily composting in the soil.

Manura – Sometimes i really need to replace nutrients and for that we use chicken or sheap manura from organic or no intensive productions.

Wild spaces – We preserve the natural spaces in the grove, like hedges or native forest, which are shelters for birds and auxiliari insects that eat some of the plagues.
